Confidence where you need it

ORACLE® Gold Partner

CardConnect for E-Business

Your Challenge **the business need**

You have a business to run, and electronic card payments are less efficient than you had hoped. The Oracle E-Business Suite offers iPayment as the card payment interface to gateways or processors, but can't complete the full cycle of payment scenarios. A successful business like yours need a successful solution: safe, smooth and flexible for payments and reconciliations.

Our Solution **safe. smooth. flexible.**

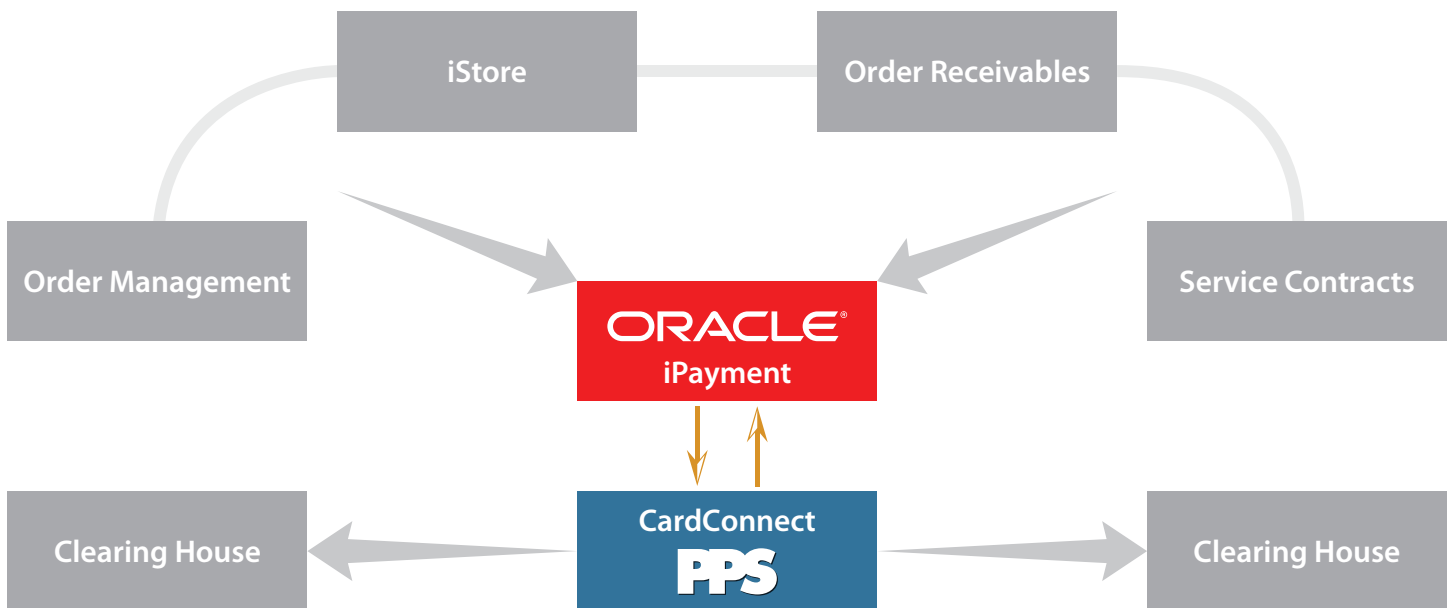

CardConnect, an Oracle-certified payment solution, has been designed with your business in mind. It provides connections for single or multiple applications in your payment landscape through HTTP connections. CardConnect *safely* sends your payment data to single or multiple domestic and international clearinghouses, and receives settlement responses. CardConnect for card payment *smooths* your processing for all types of transactions, settlements and reconciliations. *Flexible* custom reporting can enhance E-Business Suite. These features save you time and accelerate cash receipts.

In order to process credit cards, CardConnect adds the following functions to Oracle

- Collects *all* the customer's payment data, minimizing penalty fees and collection delays
- Generates the request for permission to charge the card (authorization)
- Automatically builds a list of transactions that have been authorized and delivered, and creates a special settlement file
- Transmits the settlement file to the processor, and tracks the processor's acceptance

CardConnect is implemented as an Oracle iPayment Gateway, connecting to Oracle's standard iPayment interfaces. Safe, smooth, flexible.

CardConnect smooths processing of all transactions, even non-standard items.

Enhanced Flexibility

PPS is pleased to offer add-on, customized payment capabilities to its CardConnect solution:

- Authorization Reversals & Split Deliveries: standard Oracle is awkward with multiple delivery/billings which lock up authorization limits and incur extra fees. CardConnect's Reversal tool links all billing to the original authorization, up to its maximum amount.
- CardDeposit Detail for Transaction Reconciliation: Automated detail reporting of bank deposit-level data expedites settlement, automates fee posting, and speeds resolution of exception items from the reconciliation and settlement processes. Custom reports address your specific needs.

Oracle Background

Since 2003, the Princeton Payments Solution group has addressed the specific needs of the ERP Community with respect to complex payment environments. CardConnect, (2010), is the latest version built specifically for the Oracle community and its card processing, reconciliation, and PCI compliance requirements. In 2004, PPS was the first company to encrypt data within an ERP system and pass the PCI audit standards with our Cardsecure solution. PPS was also first to create a token infrastructure, taking Oracle completely out of PCI scope. PPS clients include General Electric, Adobe, Brother, and Becton-Dickinson.

PPS Personnel

PPS staff are fully engaged with the card payment/processing security community and participate in the PCI Security Council. Their collective experience includes decades in bank operations, bank software development, and bank card technology. They enjoy personal relationships with various technical groups within the bank processing community, underpinning PPS's innovative approaches to ERP card payment issues. PPS's credentials also include advanced degrees in both business and economics. PPS staff understand your business challenges, offering payments and security expertise to match.
